

METHOD FOR TRANSFERRING A COMMAND AMONG A PLURALITY OF DEVICES IN A COMPUTER SYSTEM

Abstract

A method is used for transferring a command among a plurality of devices in a computer system to operate the computer system.

The plurality of devices at least include a first storage device and a second storage device, and the first storage device is used to store a first code. The method includes: (a) executing the first code in the first storage device; (b) after step (a), executing an examining process before the first storage device transfers the command to the second storage device; (c) after step (b), if the result of the examining process is correct, the first storage device transfers the command to the second storage device to operate the computer system; and (d) after step (b), if the result of the examining process is incorrect, the first storage device does not transfer the command to the second storage device.
